

For this project I created my first website about the game Skyrim. The goal of my site was to share information about the game and highlight some of the things I enjoy most about it. I included pages like a homepage, a gallery, a favorites page, and an information page. I tried to make my site so it matched the theme of Skyrim. I used darker colors, images from the game, and a parchment-style paper background for my information sections. My goal was to make the site fun but still easy to read and navigate.

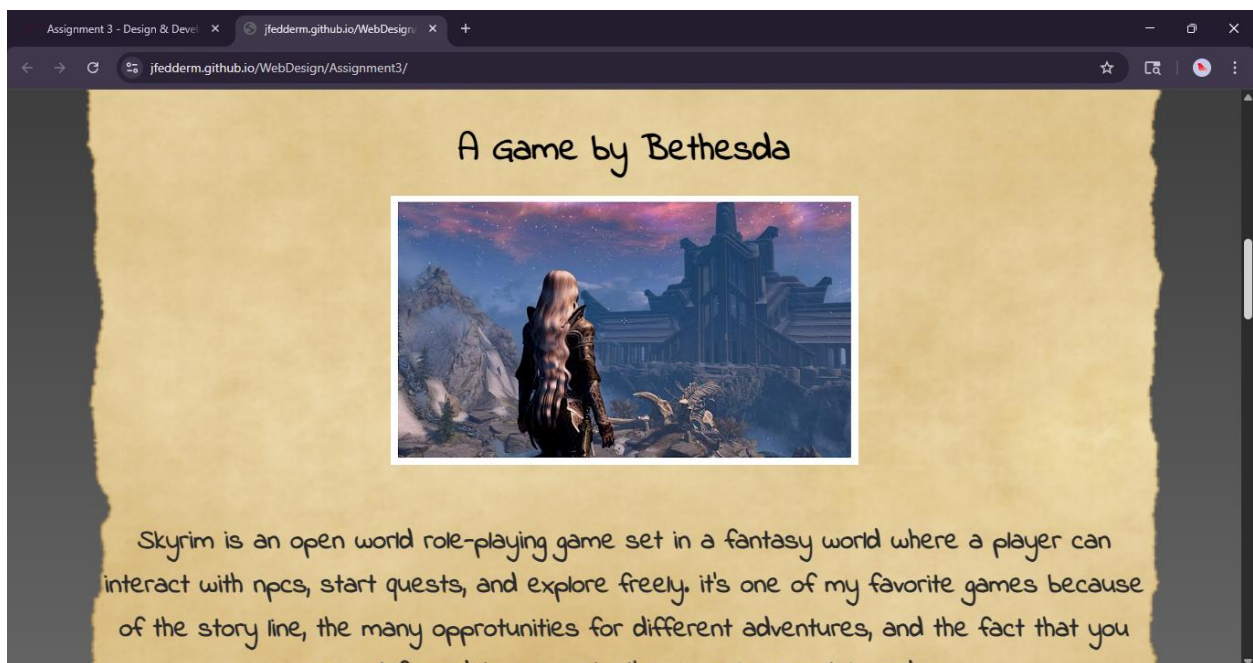

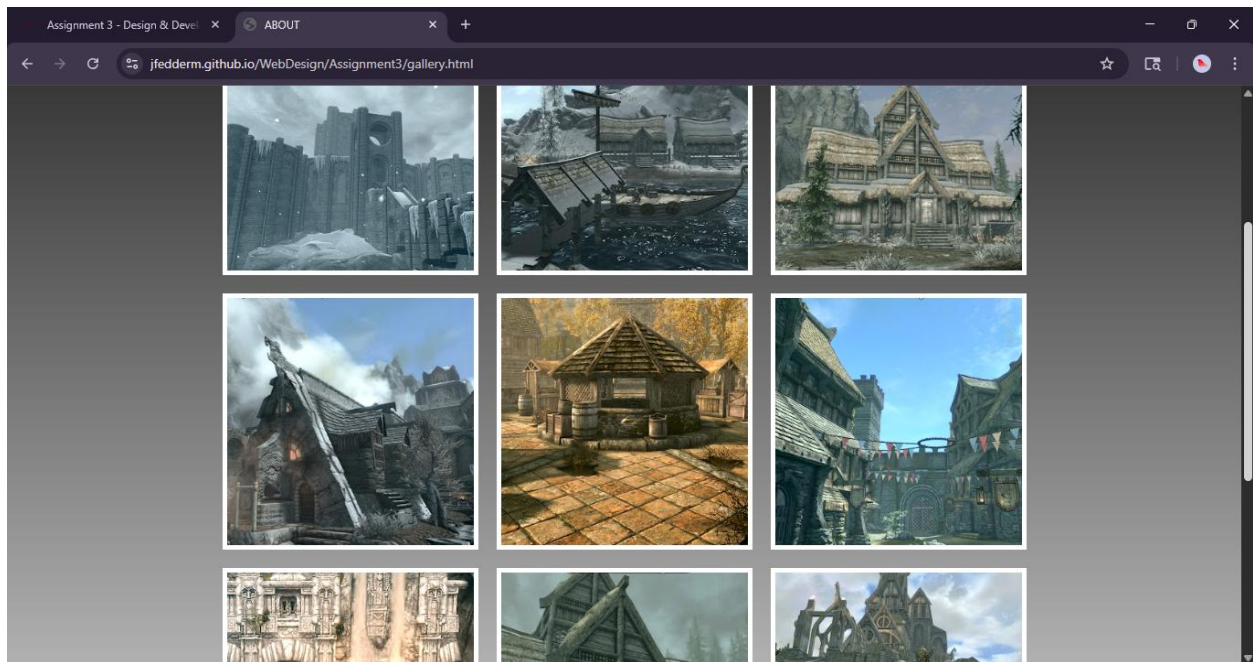

One of the things that worked well in my design was the theme. I liked how the parchment paper background helped organize the information boxes and made the font feel more connected to the style of the game. I think the navigation bar worked turned out well for me making it easy to move between pages I'm also happy to say it functions how I like. I practiced different HTML and CSS skills by including different features like images, a video, and a survey which also made my site more interesting.

There were parts of this project that were challenging. One of the biggest challenges was debugging i had a bad habit of capitalizing when I didn't need to and small typos would stop everything so using CSS and getting everything working and aligned correctly was a struggle. I usually had to slow down and read through my code carefully to find small errors and if I couldn't find errors my self I used chat gpt to help it was usually a small typo. Even though this was frustrating at times, it helped me understand how important details are when writing code.

When I navigate my own site, I'd say it's easy to move around. The navigation bar makes it clear how to access each page, and the layout is mostly consistent across the site. However, there are still things I could improve. Some spacing and alignment could be refined so the layout looks more polished. If I were working on this project again, I would spend more time planning the layout before writing the code.

One technical skill I feel stronger in now is working with CSS to control layout and styling. At the beginning of the project I didn't fully understand how CSS rules affected different parts of the page. Through trial and error I learned how padding, margins, and background images can change the layout and appearance of a website.

If I had one more week to work on this project, I would experiment with adding more interactive features to make the site more engaging. My project helped me understand both the technical and creative sides of web design. Even though there were challenges along the way, building and publishing my first website was a rewarding experience.
